

Hook Reeds

Flat Dent Type for
Top Leasing Operation

Round Pin Type for
Bottom Leasing Operation

Hook Reeds Advantages

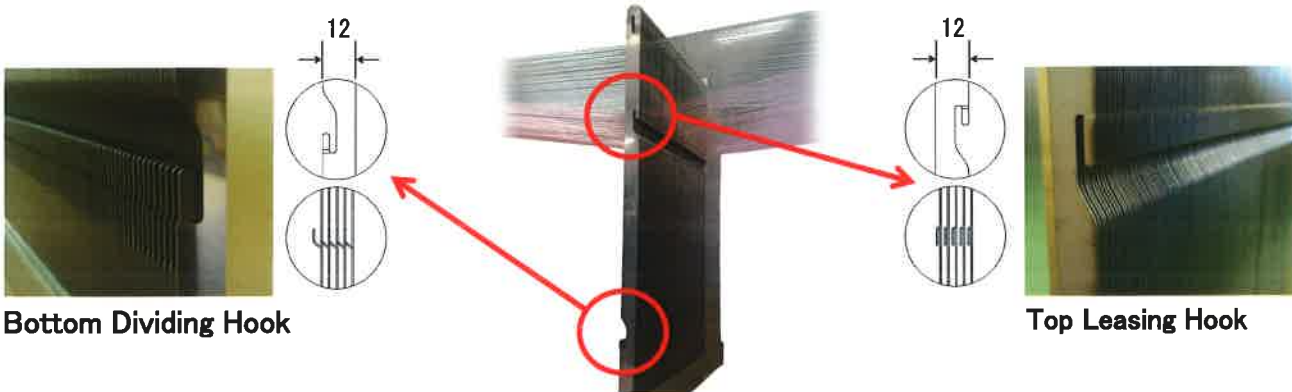

The Hook Reeds is used together with the Hook Reed Leasing Equipment to insure the proper arrangement of the warp yarns during the beaming process. The Hook Reeds comes in two types, flat-dent type (top leasing operation) and round-pin type (bottom leasing operation).

Accurate and reliable : Stable leasing process brings accurate and proper warp arrangement

High versatility : Leasing for all kinds of yarns is possible and using for varieties of industrial fabric

< Flat-Dent Type >

Stable leasing is achieved due to a special treatment of the hook segment of the reed. This new design enables proper and effective top leasing operation. 12mm width dent is used for rigidity of the reed.

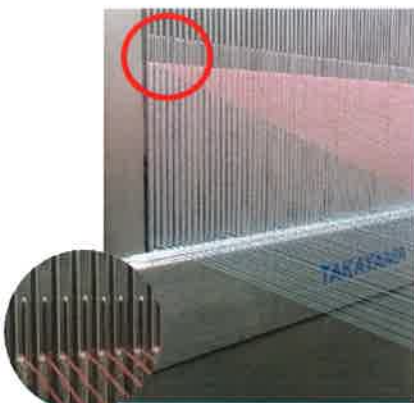

Bottom Dividing Hook

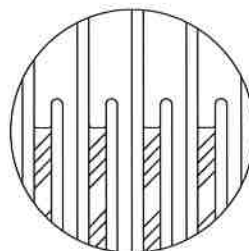

Top Leasing Hook

< Round-Pin Type >

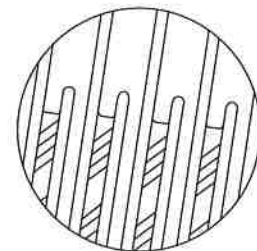

Due to the use of round pins contact resistance to the yarn is lowered, making this type of Hook Reeds especially appropriate for delicate yarns which are highly susceptible to broken filaments.
